Exercise 5

3 points possible (graded)

ESTIMATED TIME TO COMPLETE: 4 minutes

Here is a different piece of code for working with lists:

```
def applyEachTo(L, x):
    result = []
    for i in range(len(L)):
        result.append(L[i](x))
    return result
```

Suppose that you are given the following functions:

```
def square(a):
    return a*a

def halve(a):
    return a/2

def inc(a):
    return a+1
```

For each of the following questions, indicate what value is returned. If you believe that an error will occur, write the word 'error'.

1.
```
applyEachTo([inc, square, halve, abs], -3)
```

2.

```
applyEachTo([inc, square, halve, abs], 3.0)
```

3.

```
applyEachTo([inc, max, int], -3)
```
