Week 3: Structured Types > 5. Tuples and Lists > Exercise: apply to each

Exercise: apply to each

Bookmark this page

Exercise: apply to each 1

5.0 points possible (graded)

ESTIMATED TIME TO COMPLETE: 2 minutesHere is the code for a function `applyToEach`:

```
def applyToEach(L, f):
    for i in range(len(L)):
        L[i] = f(L[i])
```

Assume that

```
testList = [1, -4, 8, -9]
```

For each of the following questions (which you may assume is evaluated independently of the previous questions, so that `testList` has the value indicated above), provide an expression using `applyToEach`, so that after evaluation `testList` has the indicated value. You may need to write a simple procedure in each question to help with this process.

Example Question:

```
>>> print(testList)
[5, -20, 40, -45]
```

Solution to Example Question

```
def timesFive(a):
    return a * 5
```

```
applyToEach(testList, timesFive)
```

Practices

- ▶ Midterm Exam
- ▶ Week 5: Object Oriented Programming
- ▶ Sandbox

```
>>> print(testList)
[1, 4, 8, 9]
```

```
